

## THERMAL IMAGING

### Infrared (IR) Thermal Imaging of Panels , Machinery, Transformer etc.

Thermal Imaging using Infrared Scanning is carried out to find out any hotspots especially to identify the faults. Abnormal hotspots occur when an area is heated up indicating a possibility of occurrence of faulty condition in that particular area. The scanning is done using handheld IR camera and the data is directly analysed using software which will indicate hotspots. Thermal imaging is generally used as part of preventive maintenance to identify any potential indication of faults.

We are supplying cameras for Thermal Imaging. Also we are carrying out thermal imaging services in UAE, Kuwait, Oman & KSA.
